

# Eliminate passwords for employees with Workstation Login

## Passwords Create Risk and Frustrations

An employee's workstation is one of the most exposed access points in an organization. How can IT ensure that only legitimate users are accessing the workstation in the first place? Employees reusing weak and easy to remember passwords for their workstation increases the risk of exposure, and prompting an employee for a password every time they need to log into their work decreases productivity. Workstation Login from LastPass enables employees to gain access to their workstation, no password required, to increase both security and productivity.

## Eliminate Passwords for Employees with Workstation Login

Using the secure authentication technology of LastPass MFA, Workstation Login authenticates employees to log into their workstation using biometrics, such as fingerprint or face ID. Opposed to typing a traditional username and password, Workstation Login prompts employees to authenticate with the LastPass MFA mobile app. Workstation Login adds an additional layer of security to every single login attempt to the workstation, all while removing the workstation password from the employee's login experience.

## Enforce the Security of Strong Passwords, Without Ever Needing to Type Them

While the workstation password still exists behind the scenes, employees only experience seamless biometric authentication for their logins, while LastPass manages the rest. Workstation Login enables IT to enforce stronger passwords to secure the workstation, where employees will never have to manually type the passwords in.

## Stronger Security Across Every Business Device

IT teams are now able to implement secure biometric authentication across every user, app and device, and employees can enjoy a consistent passwordless authentication experience throughout their entire workday.

**Passwordless authentication**

**Increased security for workstation**

**Improved user experience**

**Enforce stronger passwords**
