

# Passwords Don't Have To Be Hard

We've built LastPass Enterprise to be deployed in hours, not weeks.

## How it works:

**Start your free trial:** It's the best way to set up your internal proof-of-concept. Use a new or existing LastPass account.

**Set policies:** Leave the pre-configured policies in place, or customize to your unique security needs.

**Invite users:** Whether inviting by email or leveraging AD, we help you simplify and automate onboarding.

**Assign admins:** Give select users elevated privileges for managing and securing your deployment.

**Share credentials:** Add individuals or groups to shared folders with the logins they need to work.

## How is LastPass safe?

As the leading password manager, we are obsessed with security. LastPass is SOC-2 certified, regularly audited, and built for reliability.

**Private master password:** Only you know the key to decrypt your account. It never leaves the device, and it's never shared with LastPass.

**Local-only encryption:** Sensitive data is encrypted and decrypted at the device level. We keep your information safe at every step.

**Strong encryption:** LastPass safeguards your data with 256-bit AES encryption and PBKDF2, widely recognized as the strongest encryption.
